PROFESSIONAL SKIN NEEDLING

Treatment of the year

Product innovation of the year

Make a change to your skin

Advanced professional skin needling

We all have those bugbears that affect our confidence, whether it's fine lines around the eyes, a dull complexion or maybe acne scars and stretch marks. What we all want is to be able to tackle those issues safely, without too much discomfort or downtime, and without the worry of the results looking unnatural and obvious. Well, with professional skin needling, all of those things are within your reach.

The treatment, using the highest quality, clinically proven medical devices, stimulates natural responses within your skin that over time help to regenerate it, leaving you with natural, long-lasting and outstanding results for:

- Photo-damaged and ageing skin
- Facial and décolleté lines and wrinkles
- Acne scarring
- Stretch marks

The causes of ageing skin

As you get older your skin's processes become less effective, which is when it begins to show visible signs of ageing. It produces less elastin and collagen, which keeps your skin smooth and firm, while skin cell renewal also begins to slow down. As these natural rejuvenating processes become less effective your skin's healthy cells and proteins become susceptible to lasting damage. This can result in your skin tone becoming less vibrant and the forming of fine lines and wrinkles.

The natural anti-oxidants in your skin are also significantly reduced, leaving your skin vulnerable to photo-damage, which is caused by exposure to the harmful UV rays in daylight. This damage can trigger the production of reactive oxygen species (ROS), which are harmful to the healthy cells and protein in the skin, meaning that further exposure to UV rays, and unhealthy activities such as smoking, only accelerate your skin's natural decline.

Our skin

1. Hair
2. Sensory Nerve Ending
3. Nerve
4. Capillaries
5. Sebaceous Gland
6. Fibroblast
7. Subcutaneous Tissue
8. Collagen

The causes of scarring

When the skin responds to trauma the body attempts to heal and repair itself. As part of this process it produces collagen in excessive amounts, which often knits together in an irregular manner. This disrupts the normal structure of the epidermis (the top layer of skin) and dermis (the lower layer of skin), examples of which are the indented scars that we associate with acne scarring and stretch marks. The latter occur when the epidermis and dermis are thinned and collagen fibres become stretched and run parallel to the surface of the skin.

How professional skin needling works

Professional skin needling produces thousands of micro-needle columns in the skin, which in turn stimulates the skin to naturally regenerate and repair itself.

“

My skin was scarred on my chin and cheeks after battling acne for 6 years. Following a course of 5 EDS the results have been fantastic and my skin is almost completely restored. It was worth every penny and I can't recommend the treatments enough

CLIENT OF ABSOLUTE AESTHETICS,
GUILDFORD

So what does that mean for your skin?

The holes close up quickly while your skin's natural processes are kick-started under the surface.

As part of this stimulation new collagen can be formed, new skin cells generated and the structure of the dermis, the lower level of the skin, enhanced. This natural process takes time, so it can take up to six weeks

before you see significant results – although the process will continue over the following months and several treatments are usually required.

The results are not only smoother, brighter rejuvenated skin, but it can also lead to an improvement in the appearance of acne scars and stretch marks.

REJUVENATE

The treatment

There are two treatment options for professional skin needling, EDS® Regenerate or GD® Regenerate. EDS Regenerate uses the leading electronically powered device to stimulate the epidermis and dermis, allowing your practitioner to control the intensity and needle length throughout the procedure to maximise results. EDS Regenerate is also considered to be a more comfortable treatment than manual skin-needling.

GD Regeneration uses the same high-quality sterile needles but is performed using the manual Genuine Dermaroller®. Your skin practitioner will choose

the best treatment for your skin, but rest assured, both treatment devices have been through the strictest quality control system to ensure a safe and thorough procedure.

Before your treatment is started your skin will be numbed with topical anaesthetic, so you'll remain comfortable throughout. The actual treatment will take around 20 minutes depending on the area of skin that's being treated – overall your appointment is likely to last just one hour – nothing when you consider the results that you'll see! The recommended treatment course is usually three treatments at about six weeks apart.

Maximise the results of your treatment

After the treatment your skin will remain red, looking a lot like moderate sunburn, for around 24-36 hours. Your practitioner may apply Control Tactics™, a soothing and calming gel, following your procedure – that you will continue to use this at home until the redness subsides. It's also very important to use Heliocare® every morning. This provides broad spectrum UVA/UVB protection for your skin as well as a whole host of anti-oxidants and DNA repair enzymes to further protect your skin.

Your Recover & Regenerate Home-Use Programme will contain everything you need to soothe and protect your skin during your treatment course - it'll also contain

advanced, clinically proven technologies to change your skin and enhance the results of your in-clinic treatments.

You can even continue the benefits of skin needling at home with the Genuine Dermaroller Home Roller. This device uses much shorter needles to stimulate the epidermis, the top level of skin, to improve texture, tone and fine lines. You can use it in between your in-clinic treatments to enhance results, and because the needles are much shorter there's no need for topical anaesthetic – simply follow the instructions from your skin professional.

Take a look at the results

Because the response that professional skin needling stimulates is natural, the results that you'll see are natural looking too. But that doesn't mean they won't be remarkable.
